

## Teacher can export grades

For this test you will need a course containing at least 1 student and at least 2 grade items. This test involves repeating to test exporting all, none and some grade items. It also involves repetition to check the various grade export formats Moodle supports.

Before testing the XML export, make sure the student(s) and activities have an ID number set. You can set one by editing the user's profile and the activity settings. They do not affect the other export formats but are required for XML export.

### Setup

Course was setup with two quizzes, an assignment and three externally marked items. All had id numbers. The course total didn't have an id number and couldn't be given one that I could see.

Aggregation method was Weighted mean of grades. Include empty grades.

1. Log in as a teacher and go to the gradebook within a course.
2. From the gradebook navigation choose Export - Excel spreadsheet.
3. On the next screen all grade items should be selected. Click Download.

OK

4. Check that the downloaded data is as expected.

OK

5. Click on "Excel spreadsheet" in the navigation breadcrumb. Click "select all/none" to deselect all grade items.

OK

6. Continue through the export process ensuring that the preview and downloaded data only consist of the student's details.

OK

7. Click on "Excel spreadsheet" in the navigation breadcrumb. Select one or more grade items (but not all of them).

OK

8. Continue through the export process ensuring that the preview and downloaded data only consist of the student's details and the selected grade item(s).

OK

Repeat the above for Export - Plain text file, XML and Open Document spreadsheet. For XML though, note that it is not possible to exclude the course total from the export.

### Plain text file

Passed all.

**ODS**

Passed all.

**XML**

With no items selected, no details at all in the XML file.

Other two tests OK (some or all items selected).

The course total can be excluded if it is not given an id number.
